

**Amendments to the Claims**

**Please enter the cancellation of claims 5 and 7, without prejudice, and the current amendments to claims 1 and 10, so that the claims read as follows:**

1. (Currently Amended) A method for testing an integrated circuit (IC) comprising:

employing one of a plurality of input lines to receive a test signal for a processor;

employing one of a plurality of output lines to send a test result from the processor; and

if the test result is unsuccessful, performing at least one of:

~~employing~~ selecting and automatically switching to a  
remaining one of the plurality of input lines to receive the  
test signal for the processor using a first selection signal;  
and

~~employing~~ selecting and automatically switching to a  
remaining one of the plurality of output lines to send the test  
result from the processor using a second selection signal.

2. (Original) The method of claim 1 wherein employing one of the plurality of input lines to receive the test signal for the processor includes:

applying the test signal to each of the plurality of input lines;

selecting one of the plurality of input lines; and

receiving the test signal for the processor from the selected input line.

3. (Original) The method of claim 1 wherein employing one of the plurality of output lines to send the test result from the processor includes:

applying the test result to each of the plurality of output lines;

selecting one of the plurality of output lines; and

sending the test result from the processor using the selected output line.

4. (Original) The method of claim 1 wherein employing a remaining one of the plurality of input lines to receive the test signal for the processor includes:

selecting a remaining one of the plurality of input lines;  
and

employing the selected remaining one of the plurality of input lines to receive the test signal.

5. (Canceled)

6. (Original) The method of claim 1 wherein employing a remaining one of the plurality of output lines to send the test result from the processor includes:

selecting a remaining one of the plurality of output lines; and

employing the selected remaining one of the plurality of output lines to send the test result from the processor.

7. (Canceled)

8. (Original) The method of claim 1 wherein:

employing a remaining one of the plurality of input lines to receive the test signal for the processor includes:

selecting a remaining one of the plurality of input lines;  
and

employing the selected remaining one of the plurality of input lines to receive the test signal; and

employing a remaining one of the plurality of output lines to send the test result from the processor includes:

selecting a remaining one of the plurality of output lines; and

employing the selected remaining one of the plurality of output lines to send the test result from the processor.

9. (Original) The method of claim 8 wherein:

selecting a remaining one of the plurality of input lines includes:

modifying a first select signal; and

selecting a remaining one of the plurality of input lines based on the modified first select signal; and

selecting a remaining one of the plurality of output lines includes:

modifying a second select signal; and

selecting a remaining one of the plurality of output lines based on the modified second select signal.

10. (Currently Amended) An apparatus for testing an IC comprising:

a processor within the IC;

a plurality of input lines coupled to the processor  
positioned internally within the IC;

a plurality of output lines coupled to the processor  
positioned internal within the IC; and

a connector interface coupled to the plurality of input  
lines and the plurality of output lines;

wherein the apparatus is adapted to:

employ one of the plurality of input lines to receive a  
test signal for the processor;

employ one of the plurality of output lines to send a test  
result from the processor; and

if the test result is unsuccessful, perform at least one  
of:

~~employing~~ selecting and automatically switching to a  
remaining one of the plurality of input lines to receive the  
test signal for the processor using a first selection signal;  
and

~~employing~~ selecting and automatically switching to a  
remaining one of the plurality of output lines to send the test  
result from the processor using a second selection signal.

11. (Original) The apparatus of claim 10 wherein the connector  
interface is adapted to apply the test signal to each of the  
plurality of input lines; and

further comprising a first multiplexer coupled to the  
plurality of input lines and the processor, and adapted to:

select one of the plurality of input lines; and  
receive the test signal for the processor on the selected  
input line.

12. (Original) The apparatus of claim 11 wherein the first  
multiplexer is further adapted to:

select a remaining one of the plurality of input lines;  
and

employ the selected remaining one of the plurality of  
input lines to receive the test signal.

13. (Original) The apparatus of claim 11 further comprising a third  
multiplexer coupled to the connector interface and first  
multiplexer, and adapted to modify a first select signal, the first  
select signal corresponding to the first multiplexer; and

wherein the first multiplexer is further adapted to select  
a remaining one of the plurality of input lines based on the  
modified first select signal.

14. (Original) The apparatus of claim 10 wherein the processor is  
adapted to apply the test result to each of the plurality of output  
lines; and

further comprising a second multiplexer coupled to the  
plurality of output lines and the connector interface, and adapted  
to:

select one of the plurality of output lines; and  
send the test result from the processor using the selected  
output line.

15. (Original) The apparatus of claim 14 wherein the second multiplexer is further adapted to:

select a remaining one of the plurality of output lines;  
and

employ the selected remaining one of the plurality of output lines to send the test result from the processor.

16. (Original) The apparatus of claim 15 further comprising a third multiplexer coupled to the connector interface and second multiplexer, and adapted to modify a second select signal, the second select signal corresponding to the second multiplexer; and

wherein the second multiplexer is further adapted to select a remaining one of the plurality of output lines based on the modified second select signal.

17. (Original) The apparatus of claim 10 wherein the connector interface is adapted to apply the test signal to each of the plurality of input lines; and

further comprising a first multiplexer coupled to the plurality of input lines and the processor, the first multiplexer adapted to:

select one of the plurality of input lines; and  
receive the test signal for the processor from the selected input line;

wherein the processor is further adapted to apply the test result to each of the plurality of output lines; and

further comprising a second multiplexer coupled to the plurality of output lines and the connector interface, the second multiplexer adapted to:

select one of the plurality of output lines; and  
send the test result from the processor using the selected  
output line.

18. (Original) The apparatus of claim 17 wherein:

the first multiplexer is further adapted to:  
select a remaining one of the plurality of input lines;  
and  
employ the selected remaining one of the plurality of  
input lines to receive the test signal; and  
the second multiplexer is further adapted to:  
select a remaining one of the plurality of output lines;  
and  
employ the selected remaining one of the plurality of  
output lines to send the test result from the processor.

19. (Original) The apparatus of claim 18 further comprising a third  
multiplexer coupled to the connector interface, first multiplexer  
and second multiplexer, and adapted to:

modify a first select signal, the first select signal  
corresponding to the first multiplexer; and  
modify a second select signal, the second select signal  
corresponding to the second multiplexer; and  
wherein the first multiplexer is further adapted to select  
a remaining one of the plurality of input lines based on the  
modified first select signal; and  
wherein the second multiplexer is further adapted to  
select a remaining one of the plurality of output lines based on the  
modified second select signal.

20. (Original) The apparatus of claim 10 wherein the connector interface is adapted to couple to a service processor.
